Definition 3.0.1: Limit of Sequence in \mathbb{R}

Let $\{s_n\}$ be a sequence in \mathbb{R} . We say

$$\lim_{n\to\infty} s_n = s$$

where $s \in \mathbb{R}$ if \forall real numbers $\varepsilon > 0$ \exists natural number N such that for n > N

$$s-\varepsilon < s_n < s+\varepsilon \text{ i.e. } |s-s_n| < \varepsilon$$

Question 1

Is the set x-axis \Origin a closed set

Solution: We have to take its complement and check whether that set is a open set i.e. if it is a union of open balls

Note:-

We will do topology in Normed Linear Space (Mainly \mathbb{R}^n and occasionally \mathbb{C}^n)using the language of Metric Space

Claim 3.0.1 Topology

Topology is cool

Example 3.0.1 (Open Set and Close Set)

Open Set: • φ

• $_{x \in X} B_r(x)$ (Any r > 0 will do)

• $B_r(x)$ is open

Closed Set:

• X, φ

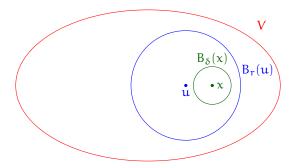

• $\overline{B_r(x)}$

x-axis $\cup y$ -axis

Theorem 3.0.1

If $x \in \text{open set } V \text{ then } \exists \ \delta > 0 \text{ such that } B_{\delta}(x) \subset V$

Proof: By openness of $V, x \in B_r(u) \subset V$

Given $x \in B_r(u) \subset V$, we want $\delta > 0$ such that $x \in B_\delta(x) \subset B_r(u) \subset V$. Let d = d(u,x). Choose δ such that $d + \delta < r$ (e.g. $\delta < \frac{r-d}{2}$)

If $y \in B_{\delta}(x)$ we will be done by showing that d(u, y) < r but

$$d(u,y) \le d(u,x) + d(x,y) < d + \delta < r$$

(2)

Corollary 3.0.1

By the result of the proof, we can then show...

Lenma 3.0.1

Suppose $v_1, ..., v_n \in \mathbb{R}^n$ is subspace of \mathbb{R}^n .

Proposition 3.0.1

1 + 1 = 2.

Random

Definition 3.0.2: Normed Linear Space and Norm $\|\cdot\|$

Let V be a vector space over \mathbb{R} (or \mathbb{C}). A norm on V is function $\|\cdot\| V \to \mathbb{R}_{\geq 0}$ satisfying

- $(1) ||x|| = 0 \iff x = 0 \ \forall \ x \in V$
- (2) $\|\lambda x\| = |\lambda| \|x\| \ \forall \ \lambda \in \mathbb{R}(\text{or } \mathbb{C}), \ x \in V$
- (3) $||x + y|| \le ||x|| + ||y|| \ \forall \ x, y \in V$ (Triangle Inequality/Subadditivity)

And V is called a normed linear space.

• Same definition works with V a vector space over C (again $\|\cdot\| \to \mathbb{R}_{\geqslant 0}$) where ② becomes $\|\lambda x\| = |\lambda| \|x\|$ $\forall \ \lambda \in \mathbb{C}, \ x \in V$, where for $\lambda = a + ib$, $|\lambda| = \sqrt{a^2 + b^2}$

Example 3.0.2 (p—Norm)

 $V=\mathbb{R}^m$, $\mathfrak{p}\in\mathbb{R}_{\geqslant 0}$. Define for $x=(x_1,x_2,\cdots,x_m)\in\mathbb{R}^m$

$$||x||_p = (|x_1|^p + |x_2|^p + \dots + |x_m|^p)^{\frac{1}{p}}$$

(In school p = 2)

Special Case p = 1: $||x||_1 = |x_1| + |x_2| + \cdots + |x_m|$ is clearly a norm by usual triangle inequality.

Special Case $p \to \infty$ (\mathbb{R}^m with $\|\cdot\|_{\infty}$): $\|x\|_{\infty} = \max\{|x_1|, |x_2|, \cdots, |x_m|\}$ For m = 1 these p-norms are nothing but |x|. Now exercise

Ouestion 2

Prove that triangle inequality is true if $p \ge 1$ for p—norms. (What goes wrong for p < 1?)

Solution: For Property (3) for norm-2

When field is \mathbb{R} :

We have to show

$$(x_i + y_i)^2 \le \left(\sqrt{x_i^2} + \sqrt{y_i^2}\right)^2$$

$$\Longrightarrow_i (x_i^2 + 2x_iy_i + y_i^2) \le x_i^2 + 2\sqrt{\left[x_i^2\right]\left[y_i^2\right]} + y_i^2$$

$$\Longrightarrow_i \left[x_iy_i\right]^2 \le \left[x_i^2\right]\left[y_i^2\right]$$

So in other words prove $\langle x, y \rangle^2 \le \langle x, x \rangle \langle y, y \rangle$ where

$$\langle x, y \rangle = x_i y_i$$

Note:-

- $||x||^2 = \langle x, x \rangle$
- $\langle x, y \rangle = \langle y, x \rangle$
- $\langle \cdot, \cdot \rangle$ is \mathbb{R} -linear in each slot i.e.

 $\langle rx + x', y \rangle = r \langle x, y \rangle + \langle x', y \rangle$ and similarly for second slot

Here in $\langle x, y \rangle$ x is in first slot and y is in second slot.

Now the statement is just the Cauchy-Schwartz Inequality. For proof

$$\langle x,y\rangle^2\leqslant \langle x,x\rangle\langle y,y\rangle$$

expand everything of $\langle x - \lambda y, x - \lambda y \rangle$ which is going to give a quadratic equation in variable λ

$$\begin{split} \langle x - \lambda y, x - \lambda y \rangle &= \langle x, x - \lambda y \rangle - \lambda \langle y, x - \lambda y \rangle \\ &= \langle x, x \rangle - \lambda \langle x, y \rangle - \lambda \langle y, x \rangle + \lambda^2 \langle y, y \rangle \\ &= \langle x, x \rangle - 2\lambda \langle x, y \rangle + \lambda^2 \langle y, y \rangle \end{split}$$

Now unless $x = \lambda y$ we have $\langle x - \lambda y, x - \lambda y \rangle > 0$ Hence the quadratic equation has no root therefore the discriminant is greater than zero.

When field is \mathbb{C} :

Modify the definition by

$$\langle x, y \rangle = \overline{x_i} \overline{y_i}$$

Then we still have $\langle x, x \rangle \ge 0$

Algorithms

```
Algorithm 1: what
   Input: This is some input
   Output: This is some output
   /* This is a comment */
 1 some code here;
